

Installation must be carried out by a qualified installer ie AV technician or someone with the relevant skills appropriate for the type of installation.

- DO NOT obstruct the **intake & outlet fan cooling system** which is located on the left underside & right underside of the screen as you face it.
- The screen requires constant airflow with a 6" clear gap around the vents.
- If there is initial **condensation** on the inside of your screen **do not worry** as this is a natural occurrence due to an outside cooler temperature versus the warm LCD panel. Within a short period of time the fan circulatory system will **remove the condensation**.
- Change dust filter when necessary. Spare dust filters are included in your accessories box
- We strongly recommend the Aqualite screen is **NOT** installed in **DIRECT SUNLIGHT** i.e. perpendicular to the screen. High ambient daylight light is OK from above, behind & from the sides.
- AquaLite Anti Reflective film available for those really high ambient light days of the year
